Read the text and answer the questions choosing the right answer.

Line number

1. It was previously believed that dinosaurs were cold-blooded creatures, like
2. reptiles. However, a recent discovery has led researchers to believe **they** may
3. have been warm-blooded. The fossilized remains of a 66 million-year-old
4. dinosaur's heart were discovered and examined by x-ray. The basis for the
5. analysis that they were warm-blooded is the number of chambers in the heart as
6. well as the existence of a single aorta.
7. Most reptiles have three chambers in their hearts, although some do have
8. four. But those that have four chambers, such as the crocodile, have two arteries
9. to mix the oxygen-heavy blood with oxygen-lean blood. Reptiles are cold-
10. blooded, meaning that they are dependent on the environment for body heat. Yet
11. the fossilized heart had four chambers in the heart as well as a single aorta. The
12. single aorta means that the oxygen-rich blood was completely separated from
13. the oxygen-poor blood and sent through the aorta to all parts of the body.
14. Mammals, on the other hand, are warm blooded, meaning that they **generate**
15. their own body heat and are thus more tolerant of temperature extremes. Birds
16. and mammals, because they are warm blooded, move more quickly and have
17. greater physical endurance than reptiles.
18. Scientists believe that the evidence now points to the idea that all dinosaurs
19. were actually warm-blooded. Ironically, the particular dinosaur in which the
20. discovery was made was a Tescelosaurus, which translates to "*marvelous*
21. *lizard*". A lizard, of course, is a reptile.
